Restaurant Platform

Full-stack web application design and implementation

Dineo Malatjie | MSc Artificial Intelligence Engineering | 2026

PROJECT SUMMARY

A refined digital experience, built as a working platform

Café Fausse is a responsive full-stack restaurant website connecting a React customer interface, Flask APIs and PostgreSQL data. Customers can explore the brand, browse a database-backed menu, reserve a table, order for collection, review a cart and checkout summary, and receive order confirmation.

01

Customer Experience

A premium interface that supports discovery,
booking and ordering.

One journey connects inspiration to collection

The completed build moves beyond a brochure website and supports the customer's full path through the restaurant experience.

- 01 Discover** Homepage specials, restaurant story and gallery visuals establish the brand.
- 02 Plan** Customers browse live menu content and complete a database-backed reservation.
- 03 Order** Click & Collect adds items to a persistent cart with quantity controls.
- 04 Confirm** Checkout shows order details and totals before pay-on-collection confirmation.

A chef in a white uniform and dark apron is carefully plating a dish on a white plate. The dish features a piece of seared meat, possibly duck, garnished with green herbs and a small amount of sauce. The chef is using a small knife to adjust the garnish. The background is a dimly lit kitchen with various cooking equipment and ingredients visible, creating a professional and focused atmosphere.

02

Engineering Foundation

A modular full-stack architecture keeps presentation, logic and data concerns separate.

Three layers keep the solution maintainable

The implementation separates the customer experience from application logic and persistent data. This reduces coupling and creates a practical foundation for future features.

REACT

Presentation

Responsive pages, reusable components, navigation, cart and checkout state.

FLASK

Application

REST APIs, validation, authentication, business logic and database access.

POSTGRESQL

Data

Menu items, reservations, orders, order items, subscribers and staff records.

LIVE DEMONSTRATION ([Video Link](#))

See the platform in action

Suggested flow: homepage → menu → reservation → Click & Collect → checkout → confirmation
